3.1 Scope

This work section provides for the supply, forming, reinforcing, and placing of concrete used in the construction of pavements, drainage structures, kerb and gutter, miscellaneous or special structures.

3.2 Standards and Guidelines

Unless stated otherwise in the Specification, the approved drawings or elsewhere in the construction documents, work shall comply with the current and relevant Australian Standards and / or RMS Standards.

Any variations or ambiguity between the Specification other construction documents and Australian Standards shall be referred to the City’s Representative for direction before proceeding with the work.

The following table indicates the Australian Standards and / or RMS Standards applicable to this section. This table is not exhaustive and may not include all standards that may apply to the work to be undertaken. It is the responsibility of the Service Provider to ensure that all relevant standards are met.

3.3 Materials

3.3.1 Concrete

All concrete used shall generally be ready-mixed concrete unless approved otherwise.

Ready-mixed concrete shall be obtained from an approved ready-mix supplier and shall comply with AS 3600 Clause 19.1 and AS 1379. Onsite-mixed concrete may be used where approved by the City’s Representative and shall comply with the current edition of the relevant Australian Standard. The methods of batching, mixing and transportation shall be to the satisfaction of the City’s Representative.

3.3.2 Concrete Properties

Concrete for the works shall have a characteristic strength ranging between 25MPa and 40MPa unless noted otherwise on the drawings. The strength will be dependent on the type of works and will be stated in the relevant section or on the drawings.

The maximum size of aggregate to be used shall be 20mm.

Concrete shall be of a consistency that it can be readily placed and compacted in the forms without segregation of the materials and without excess free water collecting on the surface. Concrete slump shall be 75mm maximum for manually placed concrete and shall be tested in accordance with AS 1012 Part 3.
Concrete for use in kerb extrusion machines shall contain the maximum amount of water which will produce such consistency that, after extrusion, the shape of the kerb will be maintained.

3.3.3 Sustainable Materials in Concrete

The City has adopted the use of the Green Building Council of Australia (GBCA)’s Green Star MAT-4 as a standard with the following composition:

- 40% cement replacement;
- 50% reclaimed water replacement;
- 40% coarse aggregate replacement; and
- 25% fine aggregate replacement.

The City will consider the following alternatives to replace standard materials:

- Portland Cement replacements:
  - Blast furnace slag;
  - Fly ash;
  - Amorphous silica (silica fume);
  - Mineral additions (limestone); and/or
  - Geopolymer techniques and products (which is generally more suited to pre-cast applications).

- Virgin aggregate replacements:
  - Recycled pavement (sourced in-situ or from external projects);
  - Reclaimed/avoided waste aggregates:
  - Ground Granulated Blast-Furnace Slag (GGBS);
  - Manufactured sands (waste processed as fine aggregate);
  - Recycled crushed glass (RCG); and
  - Any other appropriate aggregate shown to reduce embodied emissions, which performs to all appropriate standards, and with the approval of the City.

- Steel reinforcement replacements:
  - Fibre reinforced concrete (in accordance with Australian guidance and international standards).

Service Providers should design this replacement in accordance with AS 3582 - Supplementary cementitious materials for use, and should note that the City expects Service Providers to ensure adequate conditions for this replacement are met (i.e. that installation is varied where needed as a result of material replacement). For example changes to installation may include extending curing time or varying compaction rates. The final material must comply to the performance specifications below, as well as AS 3972-2010 - General purpose and blended cements.

The City prefers and encourages replacement of these materials at GBCA’s Green Star MAT-4 proportions provided. Should the Service Provider be able to exceed or not be able to achieve these proportions discussions and approval with the City must be sought.
3.3.3.1. Fibre Reinforced Concrete (FRC)
Fibre reinforced concrete (FRC) may be used in construction of the footpaths. The material shall be in accordance with appropriate standards and design loads and traffic shall comply with City’s technical specifications.
FRC shall have minimum characteristics as below:
- Compression strength of the 28-days sample shall be minimum 32 MPa.
- Tensile cracking stress of the FRC shall be minimum 6 MPa.
- Modulus of the rupture shall be minimum 6 MPa.

Mixing process of the FRC in the batching shall be in accordance with the manufacturer’s recommendation.

For Macro Poly Fibre concrete material’s specification shall be in accordance with clauses below:
- Macro Poly Fibre Reinforcement shall be added to the concrete (with F’c of 32 MPa) at the rate of 4.6 Kg/m³
- Fibre shall meet all the requirements of ASTM C1116- Type 3.
- The Dosage consists of 4kg/m³ of Macro Plastic Monofilament Poly Fibres from 40mm to 65mm long combined with 0.6kg/ m³ of a Micro Poly Fibre 10mm to 20mm long.
- The fibres shall be made from Virgin Polypropylene with a tensile strength of minimum 550Mpa and have sufficient ductility to permit 180 degree bends without rupture.
- Macro Fibres shall be continuously deformed.

3.3.4 Admixtures
The use of admixtures shall be subject to the approval of the City’s Representative.

The Service Provider shall submit to the City’s Representative details of the proposed source and nature of any admixtures and the proposed amount to be added.

Admixtures shall conform to the requirements of AS 1478 and shall not reduce the strength of the concrete. Admixtures shall not contain chlorides, chlorine, sulphur, sulphides or sulphites or any other substance detrimental to concrete or steel.

The use of chemical admixtures that result in Portland Cement reductions should be considered in relation to above sustainable materials in concrete aim, though the performance of the material must still meet or exceed all relevant design and construction requirements.

3.3.5 Sampling and Testing
The Service Provider may be required to carry out sampling and testing of concrete in accordance with the following requirements. Testing shall be carried out by an independent NATA Registered Laboratory using the relevant procedures set out in AS 1012, AS 1379 and AS 3600.

Not less than three specimens shall be made and tested for any sample representative of the day’s concrete.
Where more than 15 cubic metres of concrete is placed in one day, three test cylinders shall be made for each 15 cubic metres or part thereof. Until despatched to the laboratory, the cylinders shall be stored undisturbed at the site in a moist condition, sheltered from the sun and wind and protected from extremes of temperature. The Service Provider shall be responsible for providing the necessary curing facilities and for curing the test cylinders on the site.

One test cylinder of each of the three specimens shall be tested at 7 days, one at 28 days and the third when required by the City’s Representative. Should any two test cylinders of a set fail to fulfil the compressive strength specified, the City’s Representative may reject the whole or part of the concrete represented by these specimens in which case it shall be removed and replaced.

3.3.6 Formwork

Formwork shall be constructed of one of the following:

- Seasoned or kiln-dried timber;
- Metal shutters with joints flush fitting and adequately sealed; or
- Pressed wood or plywood supported with timber of size and spacing approved by the City’s Representative.

All exposed edges shall be chamfered not less than 20 mm x 20 mm to prevent mortar runs and to preserve smooth, straight lines. Internal angles shall be filleted where shown on the drawings.

Timber formwork shall be in long lengths free from loose knots and surface defects and uniform in thickness. Before reuse, form materials shall have all protruding nails withdrawn and surfaces to be in contact with concrete shall be thoroughly cleaned. Forms shall not be reused if bulged or warped. All inside surfaces of formwork shall be coated with non-staining mineral oil, grease or other approved agent to ensure non-adhesion of the mortar.

3.3.7 Reinforcement, Tie Bars and Dowels

Reinforcing steel for concrete pavements shall comply with the requirements of AS 1302, AS 1303, AS 1304 as appropriate.

All steel shall be clean and free from mill scale, loose rust or oil.

Tie bars shall be Grade 230S and dowels shall be Grade 230R steel, both complying with AS 1302.

Dowels shall be straight, one-piece and cut accurately to length. Ends of dowels shall be square and free from burrs.

Plastic bar chairs or plastic tipped wire chairs shall be capable of withstanding a load of 200kg mass on the chair for one hour at 23 ± 5°C without malfunction. The Service Provider shall demonstrate that the proposed chairs conform to these requirements.

All reinforcing bars and mesh shall be supplied by an Australian Certification Authority for Reinforcing Steels (ACRS) accredited supplier and shall be appropriately marked with the supplier's unique identify mark. Any reinforcing steel or mesh not marked and/or supplied from an ACRS accredited supplier shall be immediately removed from the site.
3.3.8 Shotcrete (Sprayed Concrete)

Sprayed concrete is concrete pneumatically applied at high velocity on to a surface. Application may be either a wet or dry process. A sound homogeneous product shall be provided with surface finish reasonably uniform in texture and free from blemishes.

The minimum depth of sprayed concrete to be applied shall be 100mm for raingardens and 75mm elsewhere.

Sprayed concrete lining in open drains or natural rock retaining walls shall be coloured to match the adjoining rock colour. Sprayed concrete shall have a minimum cement content of 380 kg/m³ as discharged from the nozzle and shall have a minimum compressive strength of 25 MPa at 28 days when tested by means of 75mm diameter cores taken from in-place sprayed concrete.

Core testing of finished shotcrete or on-site test panel (900x900x150mm) as determined by the City Representative shall comply with the Recommended Practice for Shotcreting in Australia. Cores shall be secured, accepted, cured, capped and tested in accordance with AS 1012. The Service Provider shall provide equipment and facilities for the taking of cores from the work. The Service Provider shall arrange for a laboratory with appropriate NATA registration for the curing and testing of the cores. Copies of test results shall be forwarded to the City’s Representative.

At least ten (10) working days prior to applying any sprayed concrete, the Service Provider shall submit to the City’s Representative details of the proposed procedures, plant, materials and mix proportions. Materials shall comply with AS 3600.

3.3.9 Epoxy Grout

Epoxy grout shall be as specified on the construction drawings and comprise of a commercial epoxy formulation of high compressive strength, greater than 100MPa. Where the Service Provider nominates to use an alternative product, full details of proposed materials and methods shall be submitted to the City’s Representative prior to using the epoxy grout.

3.4 Construction

3.4.1 General

Concrete work shall be constructed accurately to the dimensions and details shown on the approved plans or as directed by the City’s Representative.

The preparation of formation surfaces onto which concrete is to be poured shall be in accordance with the requirements of Section B2 Earthworks.

3.4.2 Erection of Formwork

Erection and strutting of formwork and falsework shall be in accordance with the requirements of AS 3610.

Formwork shall conform to the shape, lines and dimensions required in the finished concrete. Formwork shall be rigid, watertight and braced and fixed so that it will remain in
position and shape during the casting of the concrete. Formwork shall be constructed so that it can be removed without damage to the concrete.

All dirt, sawdust, shavings or other debris shall be removed from the inside of forms before placing concrete.

3.4.3 Placing and Fixing Reinforcement

Reinforcement shall be carefully formed to the dimensions and shapes shown on the approved drawings. For mild steel reinforcing bars, cold bends shall be made around a pin having a diameter of four or more times the nominal diameter of the bars.

Reinforcement shall not be bent or straightened in a manner that will damage the material. Bars with kinks or bends not shown on the plans shall not be used. Heating of reinforcement bars will not be permitted.

Where practicable, all reinforcement shall be supplied in the full lengths shown in the approved drawings. Where not practicable, the Service Provider shall splice the reinforcement by lapping where directed. The lap shall not be less than 40 times the nominal diameter of the bars.

All reinforcement shall be accurately placed in the positions shown on the plans, and shall be securely held during the placing and compacting of the concrete by wiring together with annealed iron wire of not less than 1.2mm diameter, and by blocking and supporting the forms with plastic or metal chairs, or by other approved methods. Unless otherwise shown on the drawings, the minimum clear cover to reinforcement shall be 50mm or as specified in AS 3600 – Concrete Structures.

Reinforcement supports shall be made of durable materials strong enough to withstand the imposed loads without movement of the reinforcement. They shall be positively attached to the reinforcement and of such size as to maintain the specified cover. Bars shall be tied at all intersections except where spacing is less than 300 mm in any direction when alternate intersections shall be tied.

Wooden supports shall not be used, nor shall metal supports or tie wires which extend to the surface of the concrete. Placing bars on layers of fresh concrete as the work progresses and adjusting bars during the placing of concrete will not be permitted.

All reinforcement when placed shall present a clean surface free from grease, tar, paint, oil, mud, loose mill scale, loose or thick rust.

3.4.4 Core Holes and Embedments

Prior to pouring concrete all core and embedment requirements for all trades shall be installed.

In the case of core holes or embedments not shown on the Drawings, or where temporary openings are required for construction purposes, appropriate details shall be submitted to the City’s Representative at least 7 days prior to their construction.

Reinforcing bars may generally be slightly moved to clear core holes and embedments, but they shall not be cut, nor shall any cores be cut in hardened concrete without the approval of the City’s Representative.
Where reinforcing mesh must be cut, additional reinforcing bars of at least equal strength to the cut reinforcement shall be placed at each side of the core hole or embedment.

3.4.5 Placing of Concrete

Concrete shall be transported and placed in accordance with the requirements of AS 3600.

Movement of concrete to the pour face may be by means of suitable conveyors, clean chutes, troughs or pipes which shall be made of metal, or have metal linings, or by pumping. Water shall not be used to facilitate the movement.

The concrete shall be deposited in the forms, without separation of the aggregates. Concrete shall not be dropped freely from a height greater than 1.2 metres, or be deposited in large quantities at any point and moved or worked along the forms. Where used on steep slopes, troughs and chutes shall be equipped with baffles, or be placed in short lengths in such a way that the direction of flow of the concrete is changed.

Concrete shall be deposited in horizontal layers not exceeding 600mm in thickness and compacted such that each succeeding layer is blended into the preceding one by the compaction process. The concrete shall be placed in one continuous operation between the ends of the work and/or construction joints. Care shall be taken to fill every part of the forms and to work the coarser aggregate back from the face.

Concrete shall not be moved after it has been in the forms for more than 10 minutes.

The Service Provider may be requested to keep on site and make available for inspection a log book recording each placement of concrete including:

- Date;
- The portion of work;
- Specified grade and source of concrete;
- Slump measurements; and
- Volume placed.

Unless adequate protection is provided, concrete shall not be placed during rain or when rain appears imminent. Prior to placing concrete, the area shall be clean and moist but free from any ponding of water.

No concrete shall be mixed or placed, without the approval of the City’s Representative, while the air temperature in the shade is below 5°C or above 38°C unless special precautions, approved by the City’s Representative, are taken.

Concrete affected by environmental factors before it has set, including during mixing, transport or placing, shall be liable to rejection.

Concrete shall not be placed under water.
The Service Provider shall minimise shrinkage effects by pouring the sections of the work between construction joints in a sequence such that there will be suitable time delays between adjacent pours.

3.4.5.1. Placing of FRC

Placement of FRC is not any great deal different from plain concrete the same factors must be adhered to, good careful vibration, constant level checking & flat screeding will produce the first stage of a quality slab.

Like plain concrete FRC can be placed either, manually or mechanically (this guide mainly pertains to manual placement)

All surfaces shall be finished to a smooth finish prior to applying the final finish. The constrictor shall ensure that the fibres and aggregates are not exposed in the smooth finish.

Once the smooth surface is achieved the final finish (broomed, textures or burnished) may be applied.

3.4.6 Compaction of Concrete

Concrete shall be compacted immediately after placing by immersion and/or screed vibrators accompanied by hand methods as appropriate to remove entrapped air and compact the mix.

Form vibrators shall be used where use of immersed vibrators is impracticable. Concrete shall be fully compacted and entrapped air removed, but the concrete shall not be over vibrated such that segregation is caused. Vibrators shall not come into contact with partially hardened concrete, or reinforcement embedded in it. Vibrators shall not be allowed to rest on reinforcement or be used to move concrete along the forms.

Exposed surfaces of the concrete shall be struck off and finished. Where shown on the drawings, corners and edges shall be left neatly rounded or chamfered. Re-entrant angles shall be neatly filleted or neatly rounded.

3.4.6.1 Kerb Extrusion Machines

Concrete used in kerb extrusion machines shall have a density not less than 96% of density achieved in a specimen cylinder prepared in accordance with AS 1012.8 clause 1.7.5.

The Service Provider shall carry out concrete core tests in accordance with AS 1012.14 – 1991. Intervals of such tests shall be one test per lot if requested by the City’s Representative. A lot shall be the kerb and channel cast in one day’s production. The location for testing shall be the kerb and gutter tray or where there is not a gutter, the top of the kerb, on the steepest downhill grade on which the kerb machine is travelling.

On incidental, isolated, or on works where the total length of kerb cast in one day’s production, is less than 150 linear metres, three core tests shall be conducted. The Service Provider shall request the City’s Representative to nominate the position of each test.

The Service Provider shall fill holes due to core sampling with a suitable concrete mix coloured to match the kerb and channel within 48 hours of testing.

3.4.7 Application of Shotcrete (Sprayed Concrete)
Application shall begin at the bottom of the area being sprayed and shall be built up making several passes of the nozzle over the working area. The nozzle shall be held so that the stream of material shall impinge as close to perpendicular to the surface being coated. The velocity of discharge from the nozzle, the distance of the nozzle from the surface and the amount of water in the mix shall be regulated so as to produce a dense coating with minimum rebound of the material and no sagging. Rebound material shall be removed from the surface after the initial set by air jet or other suitable means as work proceeds and disposed.

Spraying shall be discontinued if wind causes separation of the nozzle stream.

Concrete shall not be sprayed in air temperatures less than 5°C.

Construction joints shall be kept to a minimum. A joint shall be formed by placing or trimming the sprayed concrete to an angle between 30° and 45° to the sprayed concrete surface. The joint edge shall be cleaned and wetted by air-water jet before recommencing concrete spraying.

When spraying around reinforcement, concrete is to be sprayed behind the reinforcement before concrete is allowed to accumulate on the face of the reinforcement.

Adjoining surfaces not requiring sprayed concrete shall be protected from splash and spray rebound. Splash or rebound material on these adjoining surfaces shall be removed by air-water jet or other suitable means as work proceeds.

Curing shall commence within one hour of the application of sprayed concrete, except for raingarden applications and may be by water or by colourless wax emulsion curing compound complying with AS 3799 and applied in accordance with manufacturer’s specifications.

In water curing, the surface of the sprayed concrete shall be kept continuously wet for at least seven days.

Curing is not required for sprayed concrete within raingardens unless directed by the City’s Representative.
3.5  **Joints**

3.5.1  **Construction Joints (cold joint)**

Construction joints shall be formed whenever it is necessary to cease concreting for 20 minutes or longer, except at expansion joints. The location of construction joints shall be as shown on the plans or as required and approved by the City’s Representative.

These joints shall be perpendicular to the principal line of stress, and in general shall be located at points of minimum shear.

Before placing new concrete against concrete which has set, the forms shall be re-tightened and the face of the set concrete shall be roughened, cleaned of foreign matter, latent and loose or porous material and saturated with water.

The face shall then be covered uniformly with a thin coat of neat cement and water to ensure bond and concreting shall then proceed immediately.

Pre-fabricated key joints are also acceptable to be used as construction joints. All key joints shall be approved by the City’s Representative prior to use.

3.5.2  **Contraction Joint (dummy joint)**

Contraction joints shall be located as shown on the construction drawings. They can either be formed using an appropriate jointing tool or sawing once the concrete has partially cured.

Contraction joints shall be perpendicular to the principal line of stress and be one continuous line without deviation.

When concrete is reinforced, the steel should be placed in such a manner that only one half the reinforcing bars will span the joint. This establishes the plane of weakness at the joint area.

The Service Provider shall use a jointing tool for the installation of a contraction joint after the concrete has been edged, and prior to finishing of the surface.

Sawing for the installation of contraction joints it shall commence as soon as the concrete has hardened sufficiently to permit cutting the concrete without excessive ravelling, regardless of time or weather conditions.

3.5.3  **Expansion Joints**

Expansion joints shall be provided as shown on the drawings or where directed by the City’s Representative. Expansion joints shall be pre-moulded and made of either fibre, sponge rubber, plastic or bituminous impregnated cork. The expansion joint material shall be non-extruding in hot weather, or brittle in cold weather. All joints shall be neatly finished with an edging tool.

An expansion joint shall always be used where a concrete member will join or abut an existing structure of any type.
3.6 Surface Finishes

Kerb and gutter shall be finished with a steel trowel. Edges shall be finished with round chamfers as shown on the detail drawing.

In-situ concrete footways, vehicular crossings, and kerb ramps shall be finished with a medium broom finish generally perpendicular to line of travel. Edges, joints and grooves shall be finished to approval with a rounded chamfer by using a steel edge or grooving tool. The smooth margin adjoining the rounded edge shall not be wider than 25mm and grooves shall not be less than 10mm deep.

All other exposed surfaces, unless otherwise shown on the Drawings or directed, shall be struck off and finished with a wooden float, and joints and edges so shown shall be left neatly tooled. Concrete shall not be disturbed after it has been in the forms for 10 minutes.

Faulty and honey-combed portions shall be taken down and rebuilt if directed by the City’s Representative.

The Service Provider shall immediately after removal of the forms, backfill the spaces adjacent to the concrete with sound material, thoroughly compacted, leaving the hole in a neat and good manner. Where kerb moulding machines are used, the Service Provider shall backfill 48 hours after placing concrete. Backfilling and/or the placement of pavement material shall only be undertaken with the prior approval of the City’s Representative.

3.7 Concrete Curing and Protection

The requirements for curing and protection shall be in accordance with AS 3600 Clause 19.1.5 and this Specification.

For all types of curing regimes, the concrete surface shall be maintained at a temperature not less than 5°C throughout the curing period.

All concrete pours shall be timed as such that the concrete has hardened sufficiently, by the time the last person leaves the site, to not allow any vandalism or graffiti to occur on the exposed faces of concrete. Where any exposed concrete is affected by graffiti it shall be removed and replaced between the nearest joints.

Where appropriate or directed by the City’s Representative, all exposed surfaces of the freshly placed concrete shall be kept moist either by the use of plastic sheeting, damp sand, hessian cloth or commercial curing compounds, in accordance with AS 3799, for a minimum period of 72 hours. During this time the work must be adequately protected from the effects of excessive surface evaporation, rain, running water, vandalism and other causes likely to damage the concrete.

3.8 Stripping of Formwork

Formwork shall be stripped in accordance with AS 3600 Clause 19.6.2, where those requirements are more stringent than the relevant requirements of AS 3610.
3.9 Quality

Any lot, which does not meet all the requirements of this Specification, shall be rejected.

All non-conforming materials and work shall be repaired or replaced so that the Works meet all the requirements of this Specification.

3.9.1 Inspections

Give at least two working days notice for all inspections.

3.9.2 Hold and Witness Points
